

GROUPING AND AGGREGATING DATA

- 1) Write a query that shows the total number of items ordered for each product. Use the Sales.SalesOrderDetail table.

```
SELECT  
ProductID,  
SUM(OrderQty) AS TotalItemsOrdered  
FROM Sales.SalesOrderDetail  
GROUP BY ProductID;
```

Output

The screenshot shows a SQL Server query results window. At the top, there is a zoom level of 146% and a status bar indicating 'No issues found'. Below the status bar, there are tabs for 'Results' and 'Messages'. The 'Results' tab is active, displaying a table with two columns: 'ProductID' and 'TotalItemsOrdered'. The table contains five rows of data, numbered 1 through 5 in the first column.

	ProductID	TotalItemsOrdered
1	1	3
2	2	13
3	3	5
4	4	2
5	5	4

- 2) Write a query using the Production.Product table that lists the count of products in each ProductLine.

```
SELECT  
ProductLine,  
COUNT(*) AS ProductCount
```

FROM Production.Product

GROUP BY ProductLine;

Output

146 % No issues found

Results Messages

	ProductLine	ProductCount
1	NULL	226
2	M	91
3	R	100
4	S	35
5	T	52

3) Write a query that creates a sum of the LineTotal in the Sales.SalesOrderDetail table grouped by the SalesOrderID. Include only those rows where the sum exceeds 1000.

SELECT

SalesOrderID,

SUM(LineTotal) AS TotalAmount

FROM Sales.SalesOrderDetail

GROUP BY SalesOrderID

HAVING SUM(LineTotal) > 1000;

Output

146 %	▼	✔ No issues found
📊 Results	📄 Messages	
	SalesOrderID	TotalAmount
1	1001	91500.00
2	1002	50000.00
3	1003	52000.00
4	1004	5000.00
